# Maximise the Benefit of Your New Solar iBoost+

save more energy using your Solar iBoost+ We want you to get the most from owning Solar iBoost+ so here's a few tips to help capture and

# Reduce or Delay the "ON" Periods of your Current Water Heater

but your usual fuel usage and costs will be reduced. Adjust any morning settings according to up to the thermostatically set temperature of your tank so you have plenty of hot water available Change your heater settings to later in the day, after sundown if possible, as this allows the Solar and the tank is not already hot at the start of the day. your household need but mindful that greater benefits are achieved if there is excess PV available iBoost+ to preheat water in the tank using the excess PV energy. Normal water heating will top-

# Consider which Immersion Heater to Connect to

gained by installing a longer immersion or a de-stratification pump to circulate the hot water Single Immersion Systems are normally installed at the top of the tank and additional benefit is throughout the tank.

automatically. The system regularly checks that top immersion heater remains fully satisfied When the top immersion heater is satisfied the energy diverts to the bottom immersion heater the bottom to HTR2, enabling the whole tank to benefit from the cascading PV energy feature Dual Immersion Systems - we recommended connecting the top immersion heater to HTR1 and

Vary your Heating Times by Season In Summer months the Solar iBoost+ alone may provide a plentiful supply of hot water and other water heating systems can be temporarily switched off. When required the built-in Boost feature using the iBoost+ Buddy if installed. can be used for short top-ups from the grid. This is activated on the Solar iBoost+ or remotely

of grid power operation on a 5 day/2 day basis for Winter and Summer. Simply swap between the stored settings at the press of a button on the Solar iBoost+ or remotely on iBoost+ Buddy if Using the Winter / Summer / Off timed programming feature you can set and store 2 timed periods electrical water heating systems. OFF can be simply selected during holiday periods installed. This timer can, in most circumstances, replace existing economy tariff timers on

## **Ensure Your Water Tank is Well Insulated**

Enjoy the free warm water for longer. Water consumed in begin again, maximising your PV system with your Solar the morning will allow a new day's "Heating By Solar" to

### **Consumption in your Property** Minimise the Base Levels of Energy

appliances when not in use? Reducing your home's energy consumption will maximise the excess power available for Solar iBoost+ to divert. For example instead of using standby why not power down

## Add an iBoost+ Buddy

generation. Installation is simple as it pairs to your Solar iBoost+ with a press of a button. to read display keeps you informed of your available water tank is hot. Its intuitive traffic light system with easy PV energy to optimise your self consumption once your It's the ideal energy monitor and remote control accessory for Solar iBoost+ . ## Technical Specifications

## Solar iBoost+ Controller:

Control type: Operating Voltage

Maximum Permissible Loads:

Rated Impulse Voltage Withstand

Insulation Properties

Operating Ambient Temperature Range:

Approvals

EN 60730-2-7, EN 301 489-3, EN 300 220

225 x 158 x 92 mm

Pollution Degree 2 in accordance with IEC 664

13A Resistive (max 3kW immersion)

220-240 Vac

Dimensions

### Solar iBoost+ Sender:

Battery Type:

Operating Radio Frequency Battery Life Cycle

Radio Range

Operating Ambient Temperature Range

Approvals:

Dimensions:

2 x AA IEC LR6 1.5V alkaline (supplied) 868.3 MHz 1 year (user replaceable)

-5 to 40°C 1 to 30m indoors (dependant on construction and local conditions)

95 x 75 x 35 mm (excluding clamp) EN 60950, EN 301 489-3, EN 300 220

Thank you for purchasing a Solar iBoost+

# Before use, please read these instructions carefully

programming of the unit. Please keep this booklet safe for future These instructions provide information on the installation, operation and reterence.

cylinder in the form of hot water. By monitoring the amount of energy being exported to e.g. solar PV, where surplus energy generated can be stored within a domestic hot water the energy generated exceeds the amount of energy consumed within the property. Solar the National Grid the Solar iBoost+ unit will divert energy into an immersion heater when iBoost+ controls the energy delivered to the immersion heater in proportion to that The Solar iBoost+ is designed to be used in conjunction with micro-generation systems,

### Solar iBoost+ Features.

- satisfied the energy flows automatically to the second immersion heater Up to two immersion heater connections, when the first immersion heater is
- Manual Boost and programmable Timed Boost (eg. For economy settings)
- A single, battery powered, wireless sender with measurement clamp
- Displayed energy saving information
- Up to 3kW immersion heater capability
- Buddy home energy monitor Solar iBoost+ is pre-programmed for wireless connection to the optional iBoost+

# **Checks Before Commencing Installation**

installation... Please note and ensure the following before commencing any

- 1. The electrical installation of this device must only be undertaken by a suitably trained and qualified electrician; all local safety standards must be observed. All work must satisfy Building/IEE Wiring regulations in force at the time.
- Solar iBoost+ is suitable for heating water tanks with up to two immersion heaters rated up to 3kW each which MUST include a working thermostat
- There should be NO electronic controls between the Solar iBoost+ and the immersion suitable for Solar iBoost+. heater, only direct connections to the immersion and mechanical thermostat are
- 4. Where a switch is installed between the Solar iBoost+ and the immersion heater, there should be NO neon lamp on the switch

## The Solar iBoost+...

Check you have received:

## Solar iBoost+ Quick Start Guide

#### Pre-Installation

- 1. Read Checks Before Commencing Installation and ensure compliance.
- Locate a suitably ventilated, flat and vertical surface close to the hot water tank to fix
  the Solar iBoost+, observing all clearances shown on page 6. Positioning should be
  convenient for running a cable from a fused spur to the Solar iBoost+ and on to the
  immersion heater(s).

#### Connection

- Hard wire the Solar iBoost+ in accordance with the selected wiring diagram on pages 7-9 following IEE Regulations or local regulations. Replace the terminal cover but do not nower up.
- A. Connect the Measurement Clamp into the Sender and fit the batteries in the Sender.

  Keep the Sender at 1-2m from the main unit. Do NOT press the button on the Sender.
- 5. Switch on the power supply to the Solar iBoost+ and a short start up procedure runs until Water Heating Off is displayed.
- 6. Programme Time and Timed Boosts if desired, see page 15

### Locate the Sender

7. At the utility meter (NOT the Generation meter) place the Measurement Clamp over the household main incoming live cable and latch into place. Note that the Clamp must be installed on the utility meter side of any connector (or Henley) blocks. IMPORTANT: the orientation of the clamp must be observed to ensure only excess current is detected and used for water heating.

#### Commissioning

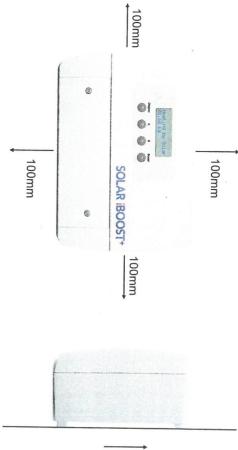

3. To commission, perform the tests shown in section 5.

### 1. Installation

#### Positioning

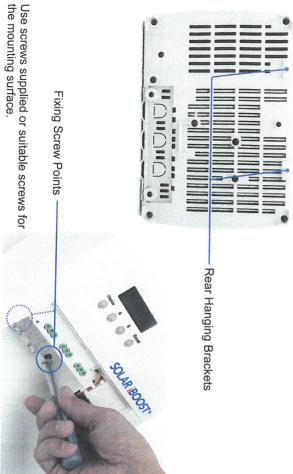

The Solar iBoost+ unit is typically located close to the hot water tank (airing cupboard or similar) and electrically connected between a fused outlet or MCB and the immersion heater.

Minimum clearance is 100mm all around. Do not allow airflow to be obstructed

## Fixing the Solar iBoost+

Two hanging brackets and two lower fixing screw points are provided:

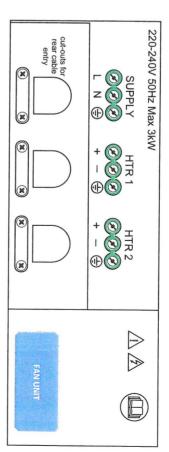

0

# 2. Connecting the Solar iBoost+

The Solar iBoost+ installation must be protected against overcurrent by connecting it via a 16A MCB or 13A fused outlet.

Remove the terminal cover, terminals are arranged as follows:

Terminal Description:

#### SUPPLY

- 220-240V Live Input-must be protected by 16A MCB or 13A fused outlet
- Z Neutral
- ·II Earth (all earth terminals common)

# HTR 1 Terminals (Connect to Immersion Heater at Top of Tank)

- + Connect to the Live terminal of the immersion heater, max 13A
- Connect to the Neutral terminal of the immersion heater
- 바

# HTR 2 Terminals (Connect to Lower Immersion Heater, if fitted)

- Connect to the Live terminal of the immersion heater, max 13A
- Connect to the Neutral terminal of the immersion heater

小

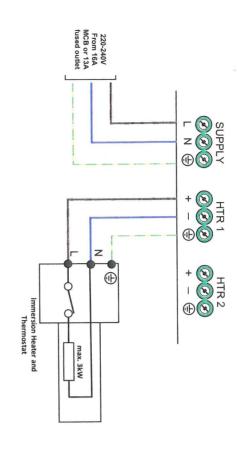

- on the pages overleaf. Hard wire the Solar iBoost+ in accordance with the selected wiring options
- multi-strand cable Terminals allow the connection of up to 4mm<sup>2</sup> solid copper conductor or
- the correct grip. clamps provided. Where necessary, invert the plastic cable clamp to provide Ensure terminals are fully tightened and cable is clamped using the cable
- Replace the terminal cover, do not switch on power at this stage (go to

### Wiring Diagrams

## Single Immersion Heater

Where a single immersion heater is fitted (most common installation) the Solar iBoost+ should be connected as shown.

->

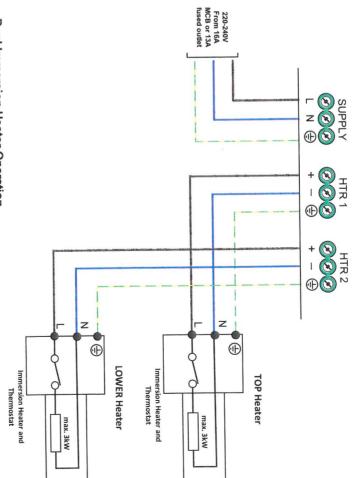

### All installations -

Test that the thermal cut-out in the immersion heater functions, replace if necessary. Do not install the Solar iBoost+ where a functioning thermostat is not present.

### **Dual Immersion Heater**

Where two immersion heaters are present, wire the heaters into the Solar iBoost+ as shown below. It is important the upper most heating element in the tank is connected to the HTR1 terminals so that this element receives heating priority.

## **Dual Immersion Heater Operation**

The Solar iBoost+ automatically detects when two immersion heaters are connected

As hot water is drawn from the upper part of the tank, it is important the heaters are connected as shown so that the Solar iBoost+ can automatically give heating priority to the top heater. Excess generation is diverted to the top heater until temperature is reached and the heater thermostat opens. Solar iBoost+ then automatically switches to the lower heater to continue to divert excess generation until the lower heater is also satisfied and 'Water Tank HOT' is displayed.

When diverting to the lower heater the Solar iBoost+ will periodically (every 15 minutes) switch to the top heater and the cycle of heating begins again. This maintains the temperature in the upper part of the tank.

An indication of the current heater being supplied is shown on the 'Heating by Solar' display, see page 13.

This operating mode is the same whether diverting excess generation or in boost function.

# 3. Assembling the Sender and Measurement Clamp

The Sender unit has a Measurement Clamp that detects export current when correctly fitted on the live incoming supply cable from the utility meter. The unit sends measurements wirelessly to the Solar iBoost+ unit.

Note: The Sender and Solar iBoost+ units are factory paired. Do not press the button on the sender or pairing may be lost.

### Assemble the Sender

1. Fit the plug from the Measurement Clamp wire into the Sender.

2. Fit batteries (included) or DC mains power supply (supplied separately).

When fitting batteries or DC power supply the sender should be at least 1-2m away from the Solar iBoost+

A DC mains power supply is available to purchase separately.

Contact your supplier for details.

Fit the connector from the power supply into the socket marked on the sender. —

3. Switch on the power to the Solar iBoost+. A set up procedure runs and the 2 devices connect automatically, usually within 30 seconds. If necessary follow the instructions for pairing on page 16.

Initialising
Please Wait

# 4. Fitting the Measurement Clamp

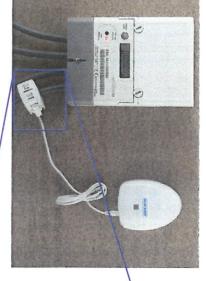

At the utility meter (Caution! not the Generation meter) identify the live cable feed to the property's consumer unit.

Open the Measurement Clamp and remove any plastic packaging. Position the clamp around the cable observing the correct orientation as shown below. Close the Clamp and ensure that the latch is engaged.

**Note**: Mechanical meters (with rotating disks) can cause distortions to measurements. Position the clamp along the meter cable, away from the base of the meter.

### Fitting Examples

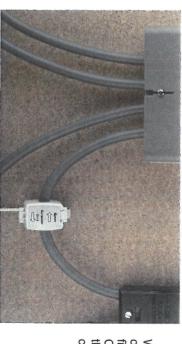

A. Utility meter live input to consumer unit without Henley /Connector blocks

B. Utility meter live input to consumer unit with Henley / Connector blocks.

Where a Henley or other connector block is fitted, the Measurement Clamp is fitted between the utility meter and the connection block.

### Test the System

These tests are designed to verify that only excess generation is used by the Solar iBoost+. Installers must check that increased energy consumption in the home results in less energy being supplied into the immersion heater. This is indicated in the 'Heating by Solar' display. The availability of high energy appliances (e.g. kettle, electric showers etc.) are useful during these tests.

- Before testing, if "Tank Hot" displays, run off some hot water.
- Perform tests 1, 2 and 4. When there is no PV generation, perform tests 3 and 4.

#### lest l

When sufficient excess generation is available and "Heating by Solar" is displayed, check that the Solar iBoost+ stops diverting energy when the PV system is off.

- Shutdown the PV array and the display changes to "Water Heating OFF."
- Reinstate the PV array.

#### Test 2

When the PV generation is above 100W, check that switching off appliances in the home results in greater energy diversion by the Solar iBoost+ unit.

- Shut down all the MCB's / Fuses except for the PV and immersion.
- Check the level of PV generation on the inverter.
- The "Heating by Solar" level should be approximately 100W less than generation.
- Reinstate MCB's / Fuses.

NB. If no reading is possible from the inverter a reduction in "Heating by Solar" value or "Water Heating OFF" should be seen after the MCB's / Fuses have been reinstated, switch on a high energy appliance if necessary.

#### Test 3

At times when no PV generation is available (e.g. commissioning after dark) test the installation by simulating export energy, achieved by reversing the orientation of the Measurement Clamp.

- Shut down the PV array
- Reverse the orientation of the measurement clamp (consumption in the home is then measured as export energy)
- Switch on a kettle or high energy device
- Whilst the kettle is on "Heating by Solar" is displayed and Solar iBoost+ function is proved.

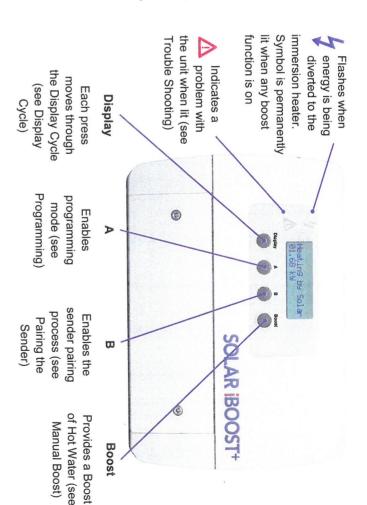

IMPORTANT! Return the clamp to its correct operating position and reinstate the PV array.

#### Test 4

Test the boost function is operational.

- Press the Boost button 2 times, "Manual Boost ON" displays
- Check that water is heating
- Scroll the Boost button until it reads "Manual Boost OFF"

### **User Operation**

### Normal Operation

During normal operation the unit will show one of the following displays

Heating by Solar 01.45 kW Htrl

Solar iBoost+ is diverting energy to the hot water tank. The instant value of energy being diverted is shown together with an indication of the immersion heater currently being supplied (if two heaters are connected will switch between Heater 1 and 2).

When energy is diverted the blue symbol flashes:

Water Tank HOT

Shown when the unit is attempting to divert energy to the immersion heater but tank has reached maximum temperature and switched off.

Water Heatins OFF

There is no excess generation for the Solar iBoost+ to divert to the hot water tank.

These messages will be overridden when other functions such as timed or manual boost are active.

#### **Display Cycle**

Display button will move through the following sequence The display cycle allows the user to view the recorded energy saving. Each press of the

disabled (e.g. for holiday periods) by selecting 'Timed Boost Season feature found at the end of the normal Boosts OFF' Display Cycle, see page 14. Boosts may be temporarily The operating boost season is set manually using the

### Pairing the Sender Unit

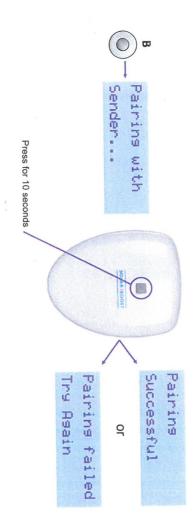

The Solar iBoost+ and Sender are supplied uniquely paired and should not require the following operation.

However, if the signal becomes lost or a new pairing is required the following procedure should be performed with the sender positioned 1m or more from the Solar iBoost+.

- Press any button on the Solar iBoost+ to switch on the backlight.
- Press and hold button B for 5 seconds then release.
- When Pairing with Sender is displayed, press and hold the green button on the Sender for up to 10 seconds to pair the devices.

Repeat the procedure if necessary until pairing is achieved.

The result of pairing is shown on the screen as follows:

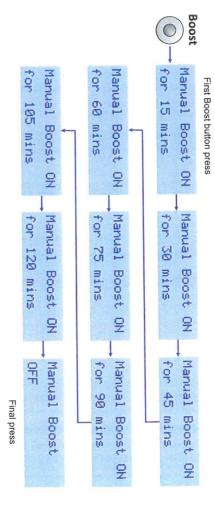

**IMPORTANT!** Do not press the sender button except when performing the pairing process. If it is pressed for more than one second the pairing may be lost and the display shows a 'Lost Signal' message (see Trouble Shooting). To correct, either reset the sender by removing and refitting the batteries or use the above procedure to reset the pairing.

#### Manual Boost

Switches on full power to the immersion heater for the period of time selected. Note that electricity is drawn from the grid if the excess generation is too low.

- . Press any button on the Solar iBoost+ to switch on the backlight.
- 2. Each press of the Boost button adds 15 minutes to the boost time up to maximum of 2 hours. The amount of time remaining is shown on the display
- To cancel the boost simply press the Boost button repeatedly until 'Manual Boost OFF' is shown.

The Boost function can be activated remotely within the home using the optional iBoost+ Buddy home energy monitor.

# Troubleshooting - Warnings and Messages

system. When a fault is detected the red warning triangle on the front of the unit is illuminated. A message on the display details the specific fault: The Solar iBoost+ internal diagnostics notify if any fault arises in the
